ADDED VALUE

For over 40 years, **NICRO** has been engaged in the development and construction of components, made out of **steel alloys**, with **high nickel content**, suitable for various industrial applications working with high temperatures and corrosive environments.

The **vast experience** gained in the production of tailor-made products allows us to identify which is the **best solution** for each request, **starting from the customer's specifications**, or through a process of **reverse engineering**.

Thanks to a highly specialized **technical department**, we can give advice to modify construction drawings, suggesting technical changes to **improve performance and service life**, or **alternative materials** depending on the application requirements and characteristics of the industrial sector of work.

The **quality materials** we use in our process are marked before storage in our 5 automated warehouses, and tracked down all along production steps, a well-organized procedure that takes advantage of the **latest technologies**.

CERTIFICATIONS

The **reputation of professionalism and reliability** we have accrued over the years is the result of two strategic elements: the continuous training of our **highly qualified staff**, and the **accurate control of all work steps** and recording of the results. **NICRO** is certified **ISO9001: 2015** and **ISO3834-2** by **SQS**.

NICRO also meets the requirements of the regulations for **ASMEIX**, **EN288.3**, and **EN287.1** welding processes, while **welders** have achieved **qualifications** for MIG / TIG, electrode, and plasma methods and for the different materials used, from major Certification Bodies.
